Received: 3 January 2019 Revised: 16 July 2019 Accepted: 19 July 2019

Abstract: In this paper, dual-complex $k$-Pell numbers and dual-complex $k$-Pell quaternions are defined. Also, some algebraic properties of dual-complex $k$-Pell numbers and quaternions which are connected with dual-complex numbers and $k$-Pell numbers are investigated. Furthermore, Honsberger Identity, d’Ocagne’s Identity, Binet’s Formula, Cassini’s Identity and Catalan’s Identity for these quaternions are given.

Keywords: Dual number, Dual-complex number, $k$-Pell number, Dual-complex $k$-Pell number, $k$-Pell quaternion, Dual-complex $k$-Pell quaternion.

2010 Mathematics Subject Classification: 11B37, 20G20, 11R52.

1 Introduction

In 1971, Horadam studied on the Pell and Pell–Lucas sequences and he gave Cassini-like formula as follows [13]:

\[ P_{n+1}P_{n-1} - P_n^2 = (-1)^n \]  \hspace{1cm} (1)

and Pell identities

\[
\begin{align*}
& P_r P_{n+1} + P_{r-1} P_n = P_{n+r} \\
& P_n(P_{n+1} + P_{n-1}) = P_{2n} \\
& P_{2n+1} + P_{2n} = 2P_{n+1}^2 - 2P_n^2 - (-1)^n \\
& P_{n+1}^2 + P_{n+2}^2 = P_{2n+1} \\
& P_n^2 + P_{n+3}^2 = 5(P_{n+1}^2 + P_{n+2}^2) \\
& P_{n+a} P_{n+b} - P_n P_{n+a+b} = (-1)^n P_n P_{n+a+b} \\
& P_{-n} = (-1)^{n+1} P_n
\end{align*}
\]  \hspace{1cm} (2)
and in 1985, Horadam and Mahon obtained Cassini-like formula as follows [14] 

\[ q_{n+1} q_{n-1} - q_n^2 = 8 (-1)^{n+1}. \]  

Many kinds of generalizations of the Pell sequence have been presented in the literature [3, 10, 15]. Furthermore, Torunbalcı Aydın and Köklü introduced the generalizations of the Pell sequence in 2017 [3] as follows:

\[
\begin{cases}
    P_0 = q, \\
    P_1 = p, \\
    P_2 = 2p + q, \\
    P_n = 2P_{n-1} + P_{n-2}, \quad n \geq 2 \\
    \text{or} \quad P_n = (p - 2q) P_n + q P_{n+1} = pP_n + qP_{n-1}
\end{cases}
\]  

(4)

In 2013, the \( k \)-Pell sequence \( \{P_{k,n}\}_{n \in \mathbb{N}} \) is defined by Catarino and Vasco [7] as follows

\[
\begin{cases}
    P_{k,0} = 0, \quad P_{k,1} = 1 \\
    P_{k,n+1} = 2 P_{k,n} + k P_{k,n-1}, \quad n \geq 1 \\
    \{P_{k,n}\}_{n \in \mathbb{N}} = \{ 0, 1, 2, k + 4, 4k + 8, k^2 + 12k + 16, ... \}
\end{cases}
\]  

(5)

Here, \( k \) is a positive real number. The studies that follows is based on the work of Catarino and Vasco [5–9, 20]. First the idea to consider Pell quaternions was suggested by Horadam in paper [13]. In the literature, the reader can find Pell quaternions and studies on their properties in [1, 2, 4, 8, 9, 11, 18, 19].

In 2017, Catarino and Vasco introduced dual \( k \)-Pell quaternions and octonions [10] as follows:

\[
\tilde{R}_{k,n} = \tilde{P}_{k,n} e_0 + \tilde{P}_{k,n+1} e_1 + \tilde{P}_{k,n+2} e_2 + \tilde{P}_{k,n+3} e_3,
\]  

(6)

where \( \tilde{P}_{k,n} = P_{k,n} + \varepsilon P_{k,n+1} \), \( P_{k,n} = 2 P_{k,n-1} + k P_{k,n-2} \), \( n \geq 2 \),

\[
e_0 = 1, \quad e_i^2 = -1, \quad e_i e_j = -e_j e_i, \quad i, j = 1, 2, 3,
\]

\[
\varepsilon \neq 0, \quad 0 \varepsilon = \varepsilon 0 = 0, \quad 1 \varepsilon = \varepsilon 1 = \varepsilon, \quad \varepsilon^2 = 0.
\]

In 2018, Gül introduced \( k \)-Pell quaternions and \( k \)-Pell–Lucas quaternions [11] as follows:

\[
Q_{P_{k,n}} = P_{k,n} + i P_{k,n+1} + j P_{k,n+2} + k P_{k,n+3}
\]  

(7)

and

\[
Q_{PL_{k,n}} = p_{k,n} + i p_{k,n+1} + j p_{k,n+2} + k p_{k,n+3},
\]  

(8)

where \( i, j, k \) satisfy the multiplication rules

\[
i^2 = j^2 = k^2 = i j k = -1, \quad i j = k = -j i, \quad j k = i = -k j, \quad k i = j = -i k.
\]

In 2018, Torunbalcı Aydın introduced dual-complex Pell and Pell–Lucas quaternions [4] (submitted) as follows:

\[
\mathbb{D} \mathbb{C}^{P_n} = \{ Q_{P_n} = P_n + i P_{n+1} + \varepsilon P_{n+2} + i \varepsilon P_{n+3} \mid P_n, \ n-\text{th Pell number} \}
\]  

(9)
and
\[ \mathbb{D}^{PL_n} = \{ Q_{PL_n} = Q_n + i Q_{n+1} + \varepsilon Q_{n+2} + i \varepsilon Q_{n+3} \mid Q_n \}, \]
(10)
where
\[ i^2 = -1, \varepsilon \neq 0, \varepsilon^2 = 0, (i \varepsilon)^2 = 0. \]

Majernik has introduced the multi-component number system [16]. There are three types of the four-component number systems which have been constructed by joining the complex, binary and dual two-component numbers. Later, Messelmi has defined the algebraic properties of the dual-complex numbers in the light of this study [17]. There are many applications for the theory of dual-complex numbers. In 2017, Gungor and Azak defined dual-complex Fibonacci and dual-complex Lucas numbers and their properties [12].

Dual-complex numbers [17] \( w \) can be expressed in the form as
\[ \mathbb{D} \mathbb{C} = \{ w = z_1 + \varepsilon z_2 \mid z_1, z_2 \in \mathbb{C} \text{ where } \varepsilon^2 = 0, \varepsilon \neq 0 \}. \]
(11)

Here if \( z_1 = x_1 + i x_2 \) and \( z_2 = y_1 + i y_2 \), then any dual-complex number can be written
\[ w = x_1 + i x_2 + \varepsilon y_1 + i \varepsilon y_2, \]
(12)
\[ i^2 = -1, \varepsilon \neq 0, \varepsilon^2 = 0, (i \varepsilon)^2 = 0. \]

Addition, substraction and multiplication of any two dual-complex numbers \( w_1 \) and \( w_2 \) are defined by
\[ w_1 \pm w_2 = (z_1 + \varepsilon z_2) \pm (z_3 + \varepsilon z_4) = (z_1 \pm z_3) + \varepsilon (z_2 \pm z_4), \]
\[ w_1 \times w_2 = (z_1 + \varepsilon z_2) \times (z_3 + \varepsilon z_4) = z_1 z_3 + \varepsilon (z_2 z_4 + z_3 z_2). \]
(13)

On the other hand, the division of two dual-complex numbers is given by
\[ \frac{w_1}{w_2} = \frac{z_1 + \varepsilon z_2}{z_3 + \varepsilon z_4}, \]
\[ \frac{(z_1 + \varepsilon z_2)(z_3 - \varepsilon z_4)}{(z_3 + \varepsilon z_4)(z_3 - \varepsilon z_4)} = \frac{z_1 z_3 + \varepsilon z_2 z_4 - z_1 z_4}{z_3^2}. \]
(14)

If \( \text{Re}(w_2) \neq 0 \), then the division \( \frac{w_1}{w_2} \) is possible. The dual-complex numbers are defined by the basis \( \{1, i, \varepsilon, i \varepsilon\} \). Therefore, dual-complex numbers, just like quaternions, are a generalization of complex numbers by means of entities specified by four-component numbers. But real and dual quaternions are non-commutative, whereas, dual-complex numbers are commutative. The real and dual quaternions form a division algebra, but dual-complex numbers form a commutative ring with characteristics 0. Moreover, the multiplication of these numbers gives the dual-complex numbers the structure of 2-dimensional complex Clifford algebra and 4-dimensional real Clifford algebra.

The base elements of the dual-complex numbers satisfy the following commutative multiplication scheme (Table 1).
Table 1. Multiplication scheme of dual-complex numbers

Five different conjugations can operate on dual-complex numbers [17] as follows:

\[ w = x_1 + i x_2 + \varepsilon y_1 + i \varepsilon y_2, \]
\[ w^{*1} = (x_1 - i x_2) + \varepsilon(y_1 - i y_2) = (z_1)^* + \varepsilon (z_2)^*, \]
\[ w^{*2} = (x_1 + i x_2) - \varepsilon(y_1 + i y_2) = z_1 - \varepsilon z_2, \]
\[ w^{*3} = (x_1 - i x_2) - \varepsilon(y_1 - i y_2) = z_1^* - \varepsilon z_2^*, \]
\[ w^{*4} = (x_1 - i x_2)(1 - \varepsilon \frac{y_1 + i y_2}{x_1 + i x_2}) = (z_1)^*(1 - \varepsilon \frac{z_2}{z_1}), \]
\[ w^{*5} = (y_1 + i y_2) - \varepsilon(x_1 + i x_2) = z_2 - \varepsilon z_1. \]

Therefore, the norm of the dual-complex numbers is defined as

\[ N_{w}^{*1} = \|w \times w^{*1}\| = \sqrt{|z_1|^2 + 2 \varepsilon Re(z_1 z_2^*)}, \]
\[ N_{w}^{*2} = \|w \times w^{*2}\| = \sqrt{|z_1|^2}, \]
\[ N_{w}^{*3} = \|w \times w^{*3}\| = \sqrt{|z_1|^2 - 2 \varepsilon Im(z_1 z_2^*)}, \]
\[ N_{w}^{*4} = \|w \times w^{*4}\| = \sqrt{|z_1|^2}, \]
\[ N_{w}^{*5} = \|w \times w^{*5}\| = \sqrt{z_1 z_2 + \varepsilon(z_2^2 - z_1^2)}. \]

In this paper, the dual-complex \(k\)-Pell numbers and the dual-complex \(k\)-Pell quaternions will be defined. The aim of this work is to present in a unified manner a variety of algebraic properties of the dual-complex \(k\)-Pell quaternions as well as both the \(k\)-Pell numbers and the dual-complex numbers. In particular, using five types of conjugations, all the properties established for dual-complex numbers and \(k\)-Pell numbers are also given for the dual-complex \(k\)-Pell quaternions. In addition, Honsberger Identity, d’Ocagne’s Identity, Binet’s Formula, Cassini’s Identity, Catalan’s Identity for these quaternions are given.

2 The dual-complex \(k\)-Pell numbers

In this section, the dual-complex \(k\)-Pell, \(k\)-Pell–Lucas and modified \(k\)-Pell numbers can be defined by the basis \(\{1, i, \varepsilon, i \varepsilon\}\), where \(i, \varepsilon\) and \(i \varepsilon\) satisfy the conditions

\[ i^2 = -1, \varepsilon \neq 0, \varepsilon^2 = 0, (i \varepsilon)^2 = 0, \]
as follows

\[ \mathbb{D} \mathbb{C} P_{k,n} = (P_{k,n} + i P_{k,n+1}) + \varepsilon (P_{k,n+2} + i P_{k,n+3}) + \varepsilon (P_{k,n+2} + i P_{k,n+3}) \]

\[ = P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3} \] (17)

\[ \mathbb{D} \mathbb{C} P L_{k,n} = (P L_{k,n} + i P L_{k,n+1}) + \varepsilon (P L_{k,n+2} + i P L_{k,n+3}) \]

\[ = P L_{k,n} + i P L_{k,n+1} + \varepsilon P L_{k,n+2} + i \varepsilon P L_{k,n+3} \] (18)

and

\[ \mathbb{D} \mathbb{C} M P_{k,n} = (M P_{k,n} + i M P_{k,n+1}) + \varepsilon (M P_{k,n+2} + i M P_{k,n+3}) \]

\[ = M P_{k,n} + i M P_{k,n+1} + \varepsilon M P_{k,n+2} + i \varepsilon M P_{k,n+3} \] (19)

With the addition, subtraction and multiplication by real scalars of two dual-complex \( k \)-Pell numbers, the dual-complex \( k \)-Pell number can be obtained again. Then, the addition and subtraction of the dual-complex \( k \)-Pell numbers are defined by

\[ \mathbb{D} \mathbb{C} P_{k,n} \pm \mathbb{D} \mathbb{C} P_{k,m} = (P_{k,n} \pm P_{k,m}) + i (P_{k,n+1} \pm P_{k,m+1}) \]

\[ + \varepsilon (P_{k,n+2} \pm P_{k,m+2}) + i \varepsilon (P_{k,n+3} \pm P_{k,m+3}) \] (20)

The multiplication of a dual-complex \( k \)-Pell number by the real scalar \( \lambda \) is defined as

\[ \lambda \mathbb{D} \mathbb{C} P_{k,n} = \lambda P_{k,n} + i \lambda P_{k,n+1} + \varepsilon \lambda P_{k,n+2} + i \varepsilon \lambda P_{k,n+3} \] (21)

By using (Table 1) the multiplication of two dual-complex \( k \)-Pell numbers is defined by

\[ \mathbb{D} \mathbb{C} P_{k,n} \times \mathbb{D} \mathbb{C} P_{k,m} = (P_{k,n} P_{k,m} - P_{k,n+1} P_{k,m+1}) \]

\[ + i (P_{k,n+1} P_{k,m} + P_{k,n} P_{k,m+1}) \]

\[ + \varepsilon (P_{k,n} P_{k,m+2} - P_{k,n+1} P_{k,m+3}) \]

\[ + \varepsilon (P_{k,n+2} P_{k,m} - P_{k,n+3} P_{k,m+1}) \]

\[ + i \varepsilon (P_{k,n+1} P_{k,m+2} + P_{k,n} P_{k,m+3}) \]

\[ + \varepsilon (P_{k,n+3} P_{k,m} + P_{k,n+2} P_{k,m+1}) \]

\[ = \mathbb{D} \mathbb{C} P_{k,m} \times \mathbb{D} \mathbb{C} P_{k,n} \] (22)

Also, there exist five conjugations as follows:

\[ \mathbb{D} \mathbb{C} P^*_{k,n} = P_{k,n} - i P_{k,n+1} + \varepsilon P_{k,n+2} - i \varepsilon P_{k,n+3}, \text{ complex-conjugation} \] (23)

\[ \mathbb{D} \mathbb{C} P^*_{k,n} = P_{k,n} + i P_{k,n+1} - \varepsilon P_{k,n+2} - i \varepsilon P_{k,n+3}, \text{ dual-conjugation} \] (24)

\[ \mathbb{D} \mathbb{C} P^*_{k,n} = P_{k,n} - i P_{k,n+1} - \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3}, \text{ coupled-conjugation} \] (25)

\[ \mathbb{D} \mathbb{C} P^*_{k,n} = (P_{k,n} - i P_{k,n+1}) (1 - \varepsilon \frac{P_{k,n+2} + i P_{k,n+3}}{P_{k,n} + i P_{k,n+1}}), \] (26)

\[ \text{dual-complex-conjugation} \]

\[ \mathbb{D} \mathbb{C} P^*_{k,n} = P_{k,n+2} + i P_{k,n+3} - \varepsilon P_{k,n} - i \varepsilon P_{k,n+1}, \text{ anti-dual-conjugation}. \] (27)

In this case, we can give the following relations:

\[ \mathbb{D} \mathbb{C} P_{k,n} (\mathbb{D} \mathbb{C} P_{k,n})^* = P^2_{k,n} + P^2_{k,n+1} + 2 \varepsilon (P_{k,n} P_{k,n+2} + P_{k,n+1} P_{k,n+3}) \]

\[ = P^2_{k,n} + P^2_{k,n+1} + 2 \varepsilon P_{k,2n+3}, \] (28)
The norm of the dual-complex \( k \)-Pell numbers \( \mathbb{D}CP_{k,n} \) is defined in five different ways as follows

\[
N_{\mathbb{D}CP_{k,n}^{*1}} = \| \mathbb{D}CP_{k,n} \times (\mathbb{D}CP_{k,n})^{*1} \|^2 \\
= (P_{k,n}^2 + P_{k,n+1}^2) + 2i(\varepsilon P_{k,n} P_{k,n+2} + P_{k,n+1} P_{k,n+3}) \\
= P_{k,n}^2 + P_{k,n+1}^2 + 2i\varepsilon P_{k,2n+3},
\]

\[
N_{\mathbb{D}CP_{k,n}^{*2}} = \| \mathbb{D}CP_{k,n} \times (\mathbb{D}CP_{k,n})^{*2} \|^2 \\
= |(P_{k,n}^2 - P_{k,n+1}^2) + 2i P_{k,n} P_{k,n+1}|, \\
\]

\[
N_{\mathbb{D}CP_{k,n}^{*3}} = \| \mathbb{D}CP_{k,n} \times (\mathbb{D}CP_{k,n})^{*3} \|^2 \\
= (P_{k,n}^2 + P_{k,n+1}^2) + 2i\varepsilon(P_{k,n} P_{k,n+3} - P_{k,n+1} P_{k,n+2}) \\
= P_{k,n}^2 + P_{k,n+1}^2 - 4i\varepsilon(-1)^n k^n, \\
\]

\[
N_{\mathbb{D}CP_{k,n}^{*4}} = \| \mathbb{D}CP_{k,n} \times (\mathbb{D}CP_{k,n})^{*4} \|^2 \\
= P_{k,n}^2 + P_{k,n+1}^2. 
\]

**Theorem 1.** Let \( \mathbb{D}CP_{k,n}, \mathbb{D}CPL_{k,n} \) and \( \mathbb{D}CMP_{k,n} \) be the dual-complex \( k \)-Pell number, the dual-complex \( k \)-Pell–Lucas number and the dual-complex modified \( k \)-Pell number respectively. Then, the following relations hold

\[
\mathbb{D}CP_{k,n+2} = 2 \mathbb{D}CP_{k,n+1} + k \mathbb{D}CP_{k,n}, \\
\mathbb{D}CPL_{k,n+2} = 2 \mathbb{D}CPL_{k,n+1} + k \mathbb{D}CPL_{k,n}, \\
\mathbb{D}CMP_{k,n} = \mathbb{D}CP_{k,n} + k \mathbb{D}CP_{k,n-1}, \\
\mathbb{D}CMP_{k,n+1} = \mathbb{D}CP_{k,n+1} - \mathbb{D}CP_{k,n}, \\
\mathbb{D}CPL_{k,n} = 2 (\mathbb{D}CP_{k,n+1} - \mathbb{D}CP_{k,n}), \\
\mathbb{D}CPL_{k,n+1} = 2 (\mathbb{D}CP_{k,n+1} + \mathbb{D}CP_{k,n}).
\]

**Proof.** Proof of equalities can easily be done. \( \Box \)
3 The dual-complex $k$-Pell and $k$-Pell–Lucas quaternions

In this section, firstly the dual-complex $k$-Pell quaternions will be defined. The dual-complex $k$-Pell quaternions and the dual-complex $k$-Pell–Lucas quaternions and the dual-complex modified $k$-Pell quaternions are defined by using the dual-complex Pell numbers and the dual-complex Pell–Lucas numbers respectively, as follows

$$\mathbb{DC}^{Pk,n} = \{ Q_{Pk,n} = P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3} \mid P_{k,n}, \}$$

$$\mathbb{DC}^{PL,k,n} = \{ Q_{PL,k,n} = PL_{k,n} + i PL_{k,n+1} + \varepsilon PL_{k,n+2} + i \varepsilon PL_{k,n+3} \mid PL_{k,n}, n\text{-th } k\text{-Pell–Lucas number} \},$$

and

$$\mathbb{DC}^{MP,k,n} = \{ Q_{MP,k,n} = MP_{k,n} + i MP_{k,n+1} + \varepsilon MP_{k,n+2} + i \varepsilon MP_{k,n+3} \mid MP_{k,n}, n\text{-th modified } k\text{-Pell number} \},$$

where

$$i^2 = -1, \varepsilon \neq 0, \varepsilon^2 = 0, (i \varepsilon)^2 = 0.$$

Let $Q_{Pk,n}$ and $Q_{Pk,m}$ be two dual-complex $k$-Pell quaternions such that

$$Q_{Pk,n} = P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3}$$

and

$$Q_{Pk,m} = P_{k,m} + i P_{k,m+1} + \varepsilon P_{k,m+2} + i \varepsilon P_{k,m+3}.$$

Then, the addition and subtraction of two dual-complex $k$-Pell quaternions are defined in the obvious way,

$$Q_{Pk,n} \pm Q_{Pk,m} = (P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3})$$

$$\pm (P_{k,m} + i P_{k,m+1} + \varepsilon P_{k,m+2} + i \varepsilon P_{k,m+3})$$

$$= (P_{k,n} \pm P_{k,m}) + i (P_{k,n+1} \pm P_{k,m+1})$$

$$\pm \varepsilon (P_{k,n+2} \pm P_{k,m+2}) + i \varepsilon (P_{k,n+3} \pm P_{k,m+3}).$$

Multiplication of two dual-complex $k$-Pell quaternions is defined by

$$Q_{Pk,n} \times Q_{Pk,m} = (P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3})$$

$$= (P_{k,n}P_{k,m} - P_{k,n+1}P_{k,m+1})$$

$$+ i (P_{k,n+1}P_{k,m} + P_{k,n}P_{k,m+1})$$

$$\varepsilon (P_{k,n}P_{k,m+2} - P_{k,n+1}P_{k,m+3}$$

$$+ P_{k,n+2}P_{k,m} - P_{k,n+3}P_{k,m+1})$$

$$i \varepsilon (P_{k,n+1}P_{k,m+2} + P_{k,n}P_{k,m+3}$$

$$+ P_{k,n+3}P_{k,m} + P_{k,n+2}P_{k,m+1})$$

$$= Q_{Pk,m} \times Q_{Pk,n}.$$
The scaler and the dual-complex vector parts of the dual-complex $k$-Pell quaternion $(Q_{P_{k,n}})$ are denoted by

$$S_{Q_{P_{k,n}}} = P_{k,n} \text{ and } V_{Q_{P_{k,n}}} = i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3}. \quad (55)$$

Thus, the dual-complex $k$-Pell quaternion $Q_{P_{k,n}}$ is given by

$$Q_{P_{k,n}} = S_{Q_{P_{k,n}}} + V_{Q_{P_{k,n}}}. \quad (56)$$

The five types of conjugation given for the dual-complex $k$-Pell numbers are the same within the dual-complex $k$-Pell quaternions. Furthermore, the conjugation properties for these quaternions are given by the relations in (23)–(27). In the following theorem, some properties related to the dual-complex $k$-Pell quaternions are given.

**Theorem 2.** Let $Q_{P_{k,n}}$ be the dual-complex $k$-Pell quaternion. In this case, we can give the following relations:

$$2Q_{P_{k,n+1}} + kQ_{P_{k,n}} = Q_{P_{k,n+2}}, \quad (57)$$

$$(Q_{P_{k,n+1}})^2 + k(Q_{P_{k,n}})^2 = Q_{P_{k,2n+1}} - P_{k,2n+3} + i P_{k,2n+2} + \varepsilon P_{k,2n+5} + 3i \in P_{k,2n+4}. \quad (58)$$

$$(Q_{P_{k,n+1}})^2 - k^2(Q_{P_{k,n-1}})^2 = 2Q_{P_{k,2n}} - 2(P_{k,2n+2} - i P_{k,2n+1} + \varepsilon P_{k,2n+4} - 3i \in P_{k,2n+3}) \quad (59)$$

**Proof.** (56): By using (51) we get,

$$2Q_{P_{k,n+1}} + kQ_{P_{k,n}} = (2P_{k,n+1} + kP_{k,n}) + i(2P_{k,n+2} + kP_{k,n+1}) + \varepsilon(2P_{k,n+3} + kP_{k,n+2}) + i(2P_{k,n+4} + kP_{k,n+3}) = P_{k,n+2} + iP_{k,n+3} + \varepsilon P_{k,n+4} + i\varepsilon P_{k,n+5} = Q_{P_{k,n+2}}. \quad (57)$$

By using (51) we get,

$$(Q_{P_{k,n+1}})^2 + k(Q_{P_{k,n}})^2 = (P_{k,n+1}^2 + kP_{k,n}^2) - (P_{k,n+2}^2 + kP_{k,n+1}) + 2i(P_{k,n+1} P_{k,n+2} + kP_{k,n} P_{k,n+1}) + 2\varepsilon[(P_{k,n+1} P_{k,n} + kP_{k,n} P_{k,n+2}) (P_{k,n+2} P_{k,n+4} + kP_{k,n+1} P_{k,n+3})] + 2i(P_{k,n+1} P_{k,n+4} + kP_{k,n} P_{k,n+3}) + 2i[(P_{k,n+1} P_{k,n} + kP_{k,n} P_{k,n+2}) (P_{k,n} P_{k,n+3} + kP_{k,n+1} P_{k,n+2})] = (P_{k,2n+1} - P_{k,2n+3} + 2iP_{k,2n+2} + 2\varepsilon(P_{k,2n+3} - P_{k,2n+5}) + 2i (2P_{k,2n+4}) = Q_{P_{k,2n+1}} - P_{k,2n+3} + iP_{k,2n+2} + \varepsilon(P_{k,2n+3} - 2P_{k,2n+5}) + 3i \in (P_{k,2n+4}). \quad (58)$$
(58): By using (51) we get,

\[(Q_{P_{k,n+1}})^2 - k^2 (Q_{P_{k,n-1}})^2 = 2 (P_{k,2n} - 2 P_{k,2n+2}) + 2 i (2 P_{k,2n+1})
+ 2 \varepsilon (P_{k,2n+2} - P_{k,2n+4}) + 2 i \varepsilon (4 P_{k,2n+3})
= 2 (P_{k,2n} + i P_{k,2n+1} + \varepsilon P_{k,2n+2} + i \varepsilon P_{k,2n+3})
- 2 P_{k,2n+2} + 2 i P_{k,2n+1} - 2 \varepsilon P_{k,2n+4}
+ 6 i \varepsilon P_{k,2n+3}
= 2 Q_{P_{k,2n}} - 2 (P_{k,2n+2} - i P_{k,2n+1} + \varepsilon P_{k,2n+4}
- 3 i \varepsilon P_{k,2n+3}).\]

(59): By using (51) and (25) we get,

\[Q_{P_{k,n}} - i \varepsilon Q_{P_{k,n+1}} = (P_{k,n} - P_{k,n+2}) + 2 \varepsilon P_{k,n+4}.

This completes the proof. \qed

**Theorem 3.** For \(n, m \geq 0\) the Honsberger identity for the dual-complex \(k\)-Pell quaternions \(Q_{P_{k,n}}\) and \(Q_{P_{k,m}}\) is given by

\[k Q_{P_{k,n-1}} Q_{P_{k,m}} + Q_{P_{k,n}} Q_{P_{k,m+1}} = (k P_{k,n-1} P_{k,m} + P_{k,n} P_{k,m+1})
- (k P_{k,n} P_{k,m+1} + P_{k,n+1} P_{k,m+2})
+ i [(k P_{k,n-1} P_{k,m+1} + P_{k,n} P_{k,m+2})
+ (k P_{k,n} P_{k,m} + P_{k,n+1} P_{k,m+1})]
+ \varepsilon [(k P_{k,n-1} P_{k,m+2} + P_{k,n} P_{k,m+3})
- (k P_{k,n} P_{k,m+3} + P_{k,n+1} P_{k,m+4})
+ (k P_{k,n+1} P_{k,m} + P_{k,n+2} P_{k,m+1})
- (k P_{k,n+2} P_{k,m+1} + P_{k,n+3} P_{k,m+2})]
+ i [(k P_{k,n-1} P_{k,m+3} + P_{k,n} P_{k,m+4})
+ (k P_{k,n} P_{k,m+2} + P_{k,n+1} P_{k,m+3})
+ (k P_{k,n+1} P_{k,m+1} + P_{k,n+2} P_{k,m+2})
+ (k P_{k,n+2} P_{k,m} + P_{k,n+3} P_{k,m+1})]
= (P_{k,n+m} - P_{k,n+m+2}) + 2 i P_{k,n+m+1}
+ 2 \varepsilon (P_{k,n+m+2} - P_{k,n+m+4})
+ 4 i \varepsilon P_{k,n+m+3}
= Q_{P_{k,n+m}} - P_{k,n+m+2} + i P_{k,n+m+1}
+ \varepsilon (P_{k,n+m+2} - 2 P_{k,n+m+4})
+ 3 i \varepsilon P_{k,n+m+3}.

where the identity \(k P_{k,n-1} P_{k,m} + P_{k,n} P_{k,m+1} = P_{k,n+m}\) is used \[5\]. \qed
Theorem 4. Let $Q_{P_n}$ be the dual-complex $k$-Pell quaternion. Then, sum formula for these quaternions is as follows:

$$\sum_{s=0}^{n} Q_{P_k,s} = \frac{1}{k+1} \left[ Q_{P_k,n+1} + k Q_{P_k,n} - Q_{P_k,1} + Q_{P_k,0} \right].$$  \hspace{1cm} (61)

Proof. Since $\sum_{i=0}^{n} P_{k,i} = \frac{1}{k+1} (-1 + P_{k,n+1} + k P_{k,n})$, we get

$$\sum_{s=0}^{n} Q_{P_k,s} = \sum_{s=0}^{n} P_{k,s} + i \sum_{s=0}^{n} P_{k,s+1} + \varepsilon \sum_{s=0}^{n} P_{k,s+2} + i \varepsilon \sum_{s=0}^{n} P_{k,s+3}$$

$$= \frac{1}{k+1} \left[ (-1 + P_{k,n+1} + k P_{k,n}) + i (-1 + P_{k,n+2} + k P_{k,n+1}) 
+ \varepsilon (-2 - k + P_{k,n+3} + k P_{k,n+2}) 
+ i \varepsilon (-4 - 3 k + P_{k,n+4} + k P_{k,n+3}) \right]$$

$$= \frac{1}{k+1} \left[ (-P_{k,1} + P_{k,0} + P_{k,n+1} + k P_{k,n}) 
+ i (-P_{k,2} + P_{k,1} + P_{k,n+2} + k P_{k,n+1}) 
+ \varepsilon (-P_{k,3} + P_{k,2} + P_{k,n+3} + k P_{k,n+2}) 
+ i \varepsilon (-P_{k,4} + P_{k,3} + P_{k,n+4} + k P_{k,n+3}) \right]$$

$$= \frac{1}{k+1} \left[ Q_{P_k,n+1} + k Q_{P_k,n} - Q_{P_k,1} + Q_{P_k,0} \right].$$

This completes the proof. \hfill \Box

Theorem 5. (Binet’s Formula) Let $Q_{P_n}$ be the dual-complex $k$-Pell quaternion. For $n \geq 1$, Binet’s Formula for these quaternions is as follows:

$$Q_{P_k,n} = \frac{1}{\alpha - \beta} \left( \hat{\alpha} \alpha^n - \hat{\beta} \beta^n \right),$$  \hspace{1cm} (62)

where

$$\hat{\alpha} = 1 + i \alpha + \varepsilon \alpha^2 + i \varepsilon \alpha^3, \quad \alpha = 1 + \sqrt{2}$$

and

$$\hat{\beta} = 1 + i \beta + \varepsilon \beta^2 + i \varepsilon \beta^3, \quad \beta = 1 - \sqrt{2}.$$  \hspace{1cm} (63)

Proof. Binet’s formula of $k$-Pell number [20] is

$$P_{k,n} = \frac{1}{\alpha - \beta} \left( \alpha^n - \beta^n \right),$$

where $\alpha = 1 + \sqrt{1+k}, \beta = 1 - \sqrt{1+k}, \alpha + \beta = 2, \alpha - \beta = 2 \sqrt{1+k}, \alpha \beta = -k$. Binet’s formula of $k$-Pell quaternion [20] is

$$Q P_{k,n} = \frac{1}{\alpha - \beta} \left( \hat{\alpha} \alpha^n - \hat{\beta} \beta^n \right),$$
where $\hat{\alpha} = 1 + i \alpha + j \alpha^2 + k \alpha^3$, $\hat{\beta} = 1 + i \beta + j \beta^2 + k \beta^3$.

Using (51) and (62), the proof is easily seen.

$$Q P_{k,n} = P_{k,n} + i P_{k,n+1} + \varepsilon P_{k,n+2} + i \varepsilon P_{k,n+3}$$

$$= \frac{a^n-b^n}{a-b} + i \left( \frac{a^{n+1}-b^{n+1}}{a-b} + \varepsilon \left( \frac{a^{n+2}-b^{n+2}}{a-b} \right) \right) + i \varepsilon \left( \frac{a^{n+3}-b^{n+3}}{a-b} \right)$$

$$= \frac{a^n(1+i\alpha+\varepsilon\alpha^2+i\varepsilon\alpha^3) - b^n(1+i\beta+\varepsilon\beta^2+i\varepsilon\beta^3)}{a-b}$$

$$= \frac{1}{2\sqrt{1+k}} \left( \hat{\alpha}^n - \hat{\beta}^n \right),$$

where $\hat{\alpha} = 1 + i \alpha + \varepsilon \alpha^2 + i \varepsilon \alpha^3$, $\hat{\beta} = 1 + i \beta + \varepsilon \beta^2 + i \varepsilon \beta^3$.

\[\square\]

**Theorem 6. (d’Ocagne’s Identity)** For $n, m \geq 0$ the d’Ocagne’s Identity for the dual-complex $k$-Pell quaternions $Q_{P_{k,n}}$ and $Q_{P_{k,m}}$ is given by

$$Q_{P_{k,m}} Q_{P_{k,n+1}} - Q_{P_{k,m+1}} Q_{P_{k,n}} = (-1)^n k^n P_{k,m-n} \left[ (1+k) + 2i \right. \left. + (2k^2+6k+4) \varepsilon + (4k+8) i \varepsilon \right].$$

**Proof.** By using (62) we get,

$$Q_{P_{k,m}} Q_{P_{k,n+1}} - Q_{P_{k,m+1}} Q_{P_{k,n}} = \left( \frac{\hat{\alpha} a^n - \beta b^n}{a-b} \right) \left( \frac{\hat{\alpha} a^{n+1} - \beta b^{n+1}}{a-b} \right) - \left( \frac{\hat{\alpha} a^{n+1} - \beta b^{n+1}}{a-b} \right) \left( \frac{\hat{\alpha} a^{n} - \beta b^{n}}{a-b} \right)$$

$$= \frac{1}{(a-b)^2} (\hat{\alpha} \beta)^n (a^{m-n} - b^{m-n}) (a - \beta)$$

$$= \frac{1}{(a-b)^2} (\hat{\alpha} \beta)^n (a^{m-n} - b^{m-n})$$

$$= \frac{1}{(a-b)^2} (\hat{\alpha} \beta)^n (a^{m-n} - b^{m-n})$$

$$= \left( \frac{\hat{\alpha} \beta}{a-b} \right)^n P_{k,m-n}$$

$$= (-1)^n k^n P_{k,m-n} \left[ (1+k) + 2i \right. \left. + (2k^2+6k+4) \varepsilon + (4k+8) i \varepsilon \right],$$

where $(\hat{\alpha} \beta) = (1 - \alpha \beta) + i (\alpha + \beta) + \varepsilon(\alpha^2 + \beta^2 - \alpha^3 \beta) + i \varepsilon(\alpha^3 + \beta^3 - \alpha \beta^2 - \alpha^2 \beta) = [(1+k) + 2i + (2k^2+6k+4) \varepsilon + (4k+8) i \varepsilon]$.

Calculate with a second method: By using (51) we get,

$$Q_{P_{k,m}} Q_{P_{k,n+1}} - Q_{P_{k,m+1}} Q_{P_{k,n}} = \left[ (P_{k,m} P_{k,n+1} - P_{k,m+1} P_{k,n}) ight.$$

$$- (P_{k,m+1} P_{k,n+2} - P_{m+2} P_{n+1}) ]$$

$$+ i \left[ P_{k,m} P_{k,n+2} - P_{k,m+2} P_{k,n} \right]$$

$$+ \varepsilon \left[ (P_{k,m} P_{k,n+3} - P_{k,m+1} P_{k,n+2}) ight.$$

$$- (P_{k,m+1} P_{k,n+4} - P_{m+2} P_{n+3}) ]$$

$$+ (P_{k,m+2} P_{k,n+1} - P_{k,m+3} P_{k,n})$$

$$- (P_{k,m+3} P_{k,n+2} - P_{k,m+4} P_{k,n+1}) ]$$

121
Proof. By using (62) we get,
\[
\begin{align*}
&= (-1)^n k^n (1 + k) P_{m-n} \\
&\quad + 2i (-1)^n k^n P_{m-n} \\
&\quad + \varepsilon \left[ (-1)^n k^n (1 + k) \right] \\
&\quad \left( k^2 P_{m-n-2} + P_{m-n-2} \right) \\
&\quad + i \varepsilon \left[ (-1)^n k^n (4k + 8) P_{k,m-n} \right] \\
&= (-1)^n k^n P_{k,m-n} \left[ (1 + k) + 2i \\
&\quad + (2k^2 + 6k + 4) \varepsilon + (4k + 8) i \varepsilon \right],
\end{align*}
\]
where the identity \( P_{k,m} P_{k,n+1} - P_{k,m} P_{k,n} = (-1)^n k^n P_{k,m-n} \) are used [6]. Furthermore,
\[
\begin{align*}
P_{k,m+2} P_{k,n+1} - P_{k,m+1} P_{k,n+2} &= (-1)^n k^{n+1} P_{k,m-n}, \\
P_{k,m} P_{k,n+2} - P_{k,m+2} P_{k,n} &= 2 (-1)^n k^n P_{k,m-n}, \\
P_{k,n+3} - P_{k,n+2} P_{k,n} &= (-1)^n k^{n+2} P_{k,m-n-2}, \\
P_{k,m+2} P_{k,n+1} - P_{k,m+3} P_{k,n} &= (-1)^n k^n P_{k,m-n+2}, \\
P_{k,m+4} P_{k,n+1} - P_{k,m+3} P_{k,n+2} &= (-1)^n k^{n+1} P_{k,m-n+2}, \\
P_{k,m+2} P_{k,n+3} - P_{k,m+1} P_{k,n+4} &= (-1)^n k^{n+3} P_{k,m-n-2}, \\
P_{k,m} P_{k,n+4} - P_{k,m+4} P_{k,n} &= (-1)^n k^n (8 + 4k) P_{k,m-n}, \\
P_{k,m-n+2} + k^2 P_{k,m-n-2} &= (2k + 4) P_{k,m-n}.
\end{align*}
\]
are used. □

**Theorem 7. (Cassini’s Identity)** Let \( Q_{P_{k,n}} \) be the dual-complex \( k \)-Pell quaternion. For \( n \geq 1 \), Cassini’s Identity for \( Q_{P_{k,n}} \) is as follows:
\[
Q_{P_{k,n-1}} Q_{P_{k,n+1}} - Q_{P_{k,n}}^2 = (-1)^n k^{n-1} \left[ (1 + k) + 2i \\
+ (2k^2 + 6k + 4) \varepsilon + (4k + 8) i \varepsilon \right].
\]  
(65)

**Proof.** By using (62) we get,
\[
\begin{align*}
Q_{P_{k,n-1}} Q_{P_{k,n+1}} - Q_{P_{k,n}}^2 &= \left( \frac{\hat{\alpha} \alpha^{n-1} - \hat{\beta} \beta^{n-1}}{\alpha - \beta} \right) \left( \frac{\hat{\alpha} \alpha^{n+1} - \hat{\beta} \beta^{n+1}}{\alpha - \beta} \right) \\
&\quad - \left( \frac{\hat{\alpha} \alpha^n - \hat{\beta} \beta^n}{\alpha - \beta} \right)^2 \\
&= \frac{-1}{(\alpha - \beta)^2} \left( \hat{\alpha} \beta \right) (\alpha \beta)^n \left( \alpha^{-1} \beta + \beta^{-1} \alpha - 2 \right) \\
&= \frac{-1}{(\alpha - \beta)^2} \left( \hat{\alpha} \beta \right) (\alpha \beta)^n \left( \alpha^{-1} \beta + \beta^{-1} \alpha - 2 \right) \\
&= \frac{-1}{(\alpha - \beta)^2} \left( \hat{\alpha} \beta \right) (\alpha \beta)^n \left( \frac{\alpha^2 + \beta^2}{\alpha \beta} - 2 \right) \\
&= \frac{-1}{(\alpha - \beta)^2} \left( \hat{\alpha} \beta \right) (\alpha \beta)^n \left( \frac{\alpha - \beta}{\alpha \beta} \right) \\
&= - (\hat{\alpha} \beta)(\alpha \beta)^{n-1}.
\end{align*}
\]
By using (62) we get
\[ (-1)^n k^{n-1} [(1 + k) + 2 i + (2 k^2 + 6 k + 4) \epsilon + (4 k + 8) i \epsilon], \]
where \((\hat{\alpha} \hat{\beta}) = (1 - \alpha \beta) + i (\alpha + \beta) + \epsilon (\alpha^2 + \beta^2 - \alpha \beta^3 - \alpha^3 \beta) + i \epsilon (\alpha^3 + \beta^3 - \alpha \beta^2 - \alpha^2 \beta) = [(1 + k) + 2 i + (2 k^2 + 6 k + 4) \epsilon + (4 k + 8) i \epsilon].\]

Calculate with a second method: By using (51) we get
\[
Q_{P_{k,n-1}} Q_{P_{k,n+1}} - (Q_{P_{k,n}})^2 = (P_{k,n-1} P_{k,n+1} - P_{n}^2) + (P_{k,n+1} - P_{k,n}) \cdot P_{k,n-2} \cdot P_{k,n} + (P_{k,n+3} - P_{k,n+2} P_{k,n+1}) + (P_{k,n+4} P_{k,n+1} - P_{k,n+4} P_{k,n}) \cdot (-i \epsilon (P_{k,n+3} P_{k,n} - P_{k,n+4} P_{k,n-1})) = (-1)^n k^{n-1} [(1 + k) + 2 i + (2 k^2 + 6 k + 4) \epsilon + (4 k + 8) i \epsilon],
\]
where the identities of the \(k\)-Pell numbers \(P_{k,n} P_{k,n+1} - P_{k,n+1} P_{k,n} = (-1)^n k^n P_{k,m-n}\) and \(P_{k,n-1} P_{k,n+1} - P_{k,n+1}^2 = (-1)^n k^{n-1}\) are used [6]. Furthermore,
\[
\begin{align*}
P_{k,n-1} P_{k,n+2} - P_{k,n} P_{k,n+1} &= 2 (-1)^n k^{n-1}, \\
P_{k,n-1} P_{k,n+3} - P_{k,n} P_{k,n+2} &= (-1)^n k^{n-1} (4 + k), \\
P_{k,n+1} P_{k,n+3} - P_{k,n} P_{k,n+4} &= (-1)^n k^n (4 + k), \\
P_{k,n+1} P_{k,n+1} - P_{k,n+2} P_{k,n} &= (-1)^n k^n, \\
P_{k,n+3} P_{k,n+1} - P_{k,n+2} P_{k,n+2} &= (-1)^n k^{n+1}, \\
P_{k,n-1} P_{k,n+4} - P_{k,n} P_{k,n+3} &= (-1)^n k^{n-1} (4 k + 8).
\end{align*}
\]
are used. \(\square\)

**Theorem 8. (Catalan’s Identity)** Let \(Q_{P_{k,n}}\) be the dual-complex \(k\)-Pell quaternion. For \(n \geq 1\), Catalan’s Identity for \(Q_{P_{k,n}}\) is as follows:
\[
Q_{P_{k,n}}^2 - Q_{P_{k,n+r}} Q_{P_{k,n-r}} = (-k)^{n-r+1} P_{k,r}^2 [(1 + k) + 2 i + (2 k^2 + 6 k + 4) \epsilon + (4 k + 8) i \epsilon].
\]

**Proof.** By using (62) we get
\[
Q_{P_{k,n-r}} Q_{P_{k,n+r}} - Q_{P_{k,n}}^2 = \frac{(\hat{\alpha} \alpha^{n-r} - \hat{\beta} \beta^{n-r})}{\alpha - \beta} \left( \frac{\alpha \alpha^{n-r} - \hat{\beta} \beta^{n-r}}{\alpha - \beta} \right) - \left( \frac{\alpha^{n-r} - \hat{\beta} \beta^n}{\alpha - \beta} \right)^2
= \frac{(\hat{\alpha} \hat{\beta})}{\alpha - \beta} (\alpha \beta) n \left[ (\alpha^{r} \hat{\beta}^r + \beta^{r} \alpha^r - 2) \right]
= \frac{1}{\alpha - \beta} \left[ (\hat{\alpha} \hat{\beta}) (\alpha \beta) n (\alpha^{r} \hat{\beta}^r + \beta^{r} \alpha^r - 2) \right]
= \frac{1}{\alpha - \beta} \left[ (\hat{\alpha} \hat{\beta}) (\alpha \beta) n (\alpha^{r} \hat{\beta}^r + \beta^{r} \alpha^r - 2) \right]
= \frac{1}{\alpha - \beta} \left[ (\hat{\alpha} \hat{\beta})(\alpha \beta) n (-\alpha^r \beta^r - \beta^r \alpha^r) \right]
= \frac{1}{\alpha - \beta} \left[ (\hat{\alpha} \hat{\beta})(\alpha \beta) n (-\alpha^r \beta^r - \beta^r \alpha^r) \right]
= (-1)^{n-r+1} k^{n-r} P_{k,r}^2 [(1 + k) + 2 i + (2 k^2 + 6 k + 4) \epsilon + (4 k + 8) i \epsilon],
\]

\[123\]
where \( (\hat{\alpha} \hat{\beta}) = (1 - \alpha \beta) + i (\alpha + \beta) + \varepsilon (\alpha^2 + \beta^2 - \alpha \beta^3 - \alpha^3 \beta) + i \varepsilon (\alpha^3 + \beta^3 - \alpha \beta^2 - \alpha^2 \beta) = (1 + k) + 2 i + (2 k^2 + 6 k + 4) \varepsilon + (4 k + 8) i \varepsilon. \)

4 Conclusion

In this study, a number of new results on dual-complex \( k \)-Pell quaternions were derived. Quaternions have great importance as they are used in quantum physics, applied mathematics, quantum mechanics, Lie groups, kinematics and differential equations.

This study fills the gap in the literature by providing the dual-complex \( k \)-Pell quaternion using definitions of the dual-complex number [20] and \( k \)-Pell number [7].
