Received: 19 July 2019 Revised: 21 April 2020 Accepted: 25 April 2020

Abstract: In this paper, circular-hyperbolic Fibonacci numbers and quaternions are defined. Also, some algebraic properties of circular-hyperbolic Fibonacci numbers and quaternions which are connected with circular-hyperbolic numbers and Fibonacci numbers are investigated. Furthermore, Honsberger’s identity, the generating function, Binet’s formula, d’Ocagne’s identity, Cassini’s identity, and Catalan’s identity for these quaternions are given.

Keywords: Fibonacci number, Hyperbolic number, Dual-hyperbolic number, Circular-hyperbolic number, Circular-hyperbolic Fibonacci number.

2010 Mathematics Subject Classification: 11B37, 20G20, 11R52.

1 Introduction

The real quaternions were first described by Irish mathematician William Rowan Hamilton in 1843. Hamilton [9] introduced a set of real quaternions which can be represented as

\[ H = \{ q = q_0 + i q_1 + j q_2 + k q_3 \mid q_0, q_1, q_2, q_3 \in \mathbb{R} \} \]  

(1)

where

\[ i^2 = j^2 = k^2 = -1, \quad i j = -j i = k, \quad j k = -k j = i, \quad k i = -i k = j. \]

The real quaternions constitute an extension of complex numbers into a four-dimensional space and can be considered as four-dimensional vectors, in the same way that complex numbers are considered as two-dimensional vectors. Horadam [10, 11] defined complex Fibonacci and Lucas quaternions as follows:
\[ Q_n = F_n + F_{n+1} i + F_{n+2} j + F_{n+3} k, \]
\[ K_n = L_n + L_{n+1} i + L_{n+2} j + L_{n+3} k, \]

where \( F_n \) and \( L_n \) denote the \( n \)-th Fibonacci and Lucas numbers, respectively. Also, the imaginary quaternion units \( i, j, k \) have the following rules
\[ i^2 = j^2 = k^2 = -1, \quad i j = -j i = k, \quad j k = -k j = i, \quad k i = -i k = j. \]

The studies that follows is based on the work of Horadam [8, 19, 20].

The dual numbers are elements of the 2-dimensional real algebra
\[ D = \{ z = x + \varepsilon y \mid \varepsilon \neq 0, \varepsilon^2 = 0, \quad x, y \in \mathbb{R} \} \tag{2} \]
generating by 1 and \( \varepsilon \), [4, 21]. The work on the dual Fibonacci numbers and quaternions can be found in [19, 20].

Hyperbolic numbers have applications in different areas of mathematics and theoretical physics. The work on the hyperbolic numbers can be found in [1, 2, 6, 18, 22, 23, 26]. The set of hyperbolic numbers \( \mathbb{H} \) can be described in the form as
\[ \mathbb{H} = \{ z = x + hy \mid h \notin \mathbb{R}, \ h^2 = 1, \ x, y \in \mathbb{R} \}. \tag{3} \]

Majernik has introduced the multicomponent number system [15, 16]. There are three types of the four-component number systems which have been constructed by joining the complex, binary and dual two-component numbers. Later, Farid Messelmi has defined the algebraic properties of the dual-complex numbers in the light of this study [17].

Dual-hyperbolic numbers [1, 3] \( w \) can be expressed in the form as
\[ \mathbb{D} \mathbb{H} = \{ w = z_1 + \varepsilon z_2 \mid z_1, z_2 \in \mathbb{H}, \text{ where } j^2 = 1, \varepsilon^2 = 0, \varepsilon \neq 0 \ (j \varepsilon)^2 = 0 \}. \tag{4} \]

Here if \( z_1 = x_1 + x_2 j \) and \( z_2 = y_1 + y_2 j \), then any dual-hyperbolic number can be written
\[ w = (x_1 + x_2 j) + \varepsilon (y_1 + y_2 j) \tag{5} \]
\[ j^2 = 1, \quad \varepsilon \neq 0, \quad \varepsilon^2 = 0, \quad \varepsilon j = j \varepsilon, \quad (j \varepsilon)^2 = 0. \tag{6} \]

where \( \in \mathbb{H} \) is set of hyperbolic numbers.

In 2019, Cihan, Azak, Güngör and Tosun [7] have defined dual-hyperbolic Fibonacci and Lucas numbers respectively, as follows
\[ DHF_n = F_n + F_{n+1} j + F_{n+2} \varepsilon + F_{n+3} j \varepsilon \tag{7} \]
\[ DHL_n = L_n + L_{n+1} j + L_{n+2} \varepsilon + L_{n+3} j \varepsilon \tag{8} \]

where \( F_n \) and \( L_n \) denote the \( n \)-th Fibonacci and Lucas numbers, respectively. Also, the imaginary quaternion units \( j, \varepsilon, j \varepsilon \) have the following rules
\[ j^2 = 1, \quad \varepsilon j = j \varepsilon, \quad \varepsilon^2 = (j \varepsilon)^2 = 0. \]
Furthermore, some algebraic properties are proven for these numbers in [3]. Circular-hyperbolic numbers [5] \( w \) can be expressed in the form as

\[
\mathbb{CH} = \{ w = z_1 + z_2 h \mid z_1, z_2 \in \mathbb{C}, \ i^2 = -1, h^2 = 1, h \neq \pm 1, (ih)^2 = 1 \},
\]

(9)

where \( \mathbb{C} \) is set of complex numbers. Here if \( z_1 = x_1 + i x_2 \) and \( z_2 = y_1 + i y_2 \), then any circular-hyperbolic number can be written

\[
w = (x_1 + i x_2) + (y_1 + i y_2) h
\]

(10)

\[
h^2 = 1, \quad h \neq \pm 1, \quad i h = -h i, \quad (ih)^2 = 1.
\]

(11)

Addition, subtraction and multiplication of any two circular-hyperbolic numbers \( w_1 \) and \( w_2 \) are defined by

\[
\begin{align*}
\frac{w_1}{w_2} &= \frac{z_1 + z_2 h}{z_3 + z_4 h} = \frac{(z_1 + z_2 h)(z_3 - z_4 h)}{(z_3 + z_4 h)(z_3 - z_4 h)} = \frac{(z_1 z_3 - z_2 z_4)}{z_3^2 - z_4^2} + \frac{(z_2 z_3 - z_1 z_4)}{z_3^2 - z_4^2} h.
\end{align*}
\]

If \( \text{Re}(w_2) \neq 0 \), then the division \( \frac{w_1}{w_2} \) is possible. The circular-hyperbolic numbers are defined by the basis \( \{1, i, h, ih\} \). The base elements of the circular-hyperbolic numbers satisfy the following commutative multiplication scheme (Table 1).

<table>
<thead>
<tr>
<th>x</th>
<th>1</th>
<th>i</th>
<th>h</th>
<th>ih</th>
</tr>
</thead>

</tbody>
</table>

Table 1. Multiplication scheme of circular-hyperbolic numbers

The circular-hyperbolic numbers, just like quaternions, are a generalization of complex hyperbolic numbers by means of entities specified by four-component numbers. But hyperbolic and dual-hyperbolic numbers are commutative, whereas, circular-hyperbolic numbers are non-commutative. Moreover, the multiplication of these numbers gives the circular-hyperbolic numbers. Five different conjugations can operate on circular-hyperbolic numbers [5] as follows:
where \( i \) is the imaginary unit. The circular-hyperbolic Fibonacci and Lucas quaternions can be defined by the basis

\[
2 \text{ The circular-hyperbolic Fibonacci quaternions}
\]

Binet’s formula, Cassini’s identity, Catalan’s identity for these quaternions are given.

Therefore, the norm of the circular-hyperbolic numbers is defined as

\[
N_w^1 = \| w \times w^1 \| = \sqrt{|z_1|^2 + |z_2|^2 + 2 \varepsilon \Re (z_1 z_2^*) h},
\]

\[
N_w^2 = \| w \times w^2 \| = \sqrt{|z_1^2 - z_2^2|},
\]

\[
N_w^3 = \| w \times w^3 \| = \sqrt{|z_1|^2 - |z_2| - 2 i \Im (z_1 z_2^*) h},
\]

\[
N_w^4 = \| w \times w^4 \| = \sqrt{|z_1|^2 - (z_1 - \frac{z_2}{z_1}) + z_1^* z_2 h},
\]

\[
N_w^5 = \| w \times w^5 \| = \sqrt{z_2 (2 i \Im z_1) - (|z_1|^2 - z_2^2) h}.
\]

In this paper, the circular-hyperbolic Fibonacci numbers and Fibonacci quaternions will be defined. In addition, the Honsberger identity, the d’Ocagne’s identity, the generating function, Binet’s formula, Cassini’s identity, Catalan’s identity for these quaternions are given.

2 The circular-hyperbolic Fibonacci quaternions

The circular-hyperbolic Fibonacci and Lucas quaternions can be defined by the basis \{1, i, h, ih\}, where \( i, h \) and \( ih \) satisfy the conditions

\[
i^2 = -1 \quad h \neq \pm 1, \quad h^2 = 1, \quad ih = -hi \quad (ih)^2 = 1,
\]

as follows

\[
\mathbb{CH}F_n = (F_n + i F_{n+1}) + (F_{n+2} + i F_{n+3}) h
\]

\[
= F_n + i F_{n+1} + h F_{n+2} + i h F_{n+3}
\]

and

\[
\mathbb{CH}L_n = (L_n + i L_{n+1}) + (L_{n+2} + i L_{n+3}) h
\]

\[
= L_n + i L_{n+1} + h L_{n+2} + i h L_{n+3}.
\]

The addition, subtraction and multiplication by real scalars of two circular-hyperbolic Fibonacci quaternions gives the circular-hyperbolic Fibonacci quaternion. Then, the addition and subtraction of the circular-hyperbolic Fibonacci quaternions are defined by

\[
\mathbb{CH}F_n \pm \mathbb{CH}F_m = (F_n \pm F_m) + i (F_{n+1} \pm F_{m+1})
\]

\[
+ h (F_{n+2} \pm F_{m+2}) + i h (F_{n+3} \pm F_{m+3}).
\]
The multiplication of a circular-hyperbolic Fibonacci quaternion by the real scalar \( \lambda \) is defined as
\[
\lambda \mathbb{CH} F_n = \lambda F_n + i \lambda F_{n+1} + h \lambda F_{n+2} + i h \lambda F_{n+3}.
\]  
(17)

By using Table 1, the multiplication of two circular-hyperbolic Fibonacci quaternions is defined by
\[
\mathbb{CH} F_n \times \mathbb{CH} F_m = (F_n F_m - F_{n+1} F_{m+1} + F_{n+2} F_{m+2} + F_{n+3} F_{m+3})
+ i (F_{n+1} F_m + F_n F_{m+1} - F_{n+2} F_{m+3} + F_{n+3} F_m + 2 h F_{n+2} F_n + F_{n+3} F_m + F_{n+3} F_{m+1})
+ h (F_n F_{m+2} - F_{n+1} F_{m+3} + F_{n+2} F_m + F_{n+3} F_{m+1})
+ i h (F_{n+1} F_{m+2} + F_n F_{m+3} + F_{n+3} F_m - F_{n+2} F_{m+1})
\neq \mathbb{CH} F_m \times \mathbb{CH} F_n.
\]  
(18)

Also, there exits five conjugations as follows:

- \( \mathbb{CH} F_n^{*1} = F_n - i F_{n+1} + h F_{n+2} - i h F_{n+3} \), complex conjugation, \( n \geq 0 \)
- \( \mathbb{CH} F_n^{*2} = F_n + i F_{n+1} - h F_{n+2} + i h F_{n+3} \), hyperbolic conjugation, \( n \geq 0 \)
- \( \mathbb{CH} F_n^{*3} = F_n - i F_{n+1} - h F_{n+2} + i h F_{n+3} \), coupled conjugation, \( n \geq 0 \)
- \( \mathbb{CH} F_n^{*4} = (F_n - i F_{n+1}) - \left( 1 - \frac{(F_{n+2} + i F_{n+3}) h}{F_n + i F_{n+1}} \right) \), complex-hyperbolic conjugation, \( n \geq 0 \)
- \( \mathbb{CH} F_n^{*5} = (F_{n+2} + i F_{n+3}) - (F_n - i F_{n+1}) h, \) anti-hyperbolic conjugation, \( n \geq 0 \)

In this case, we can give the following relations:

- \( \mathbb{CH} F_n (\mathbb{CH} F_n)^{*1} = F_{2n+1} - F_{n+1} F_{n+4} + 2 F_{n+2} (i F_{n+3} + h F_n + i h F_{n+1}), \) \( n \geq 0 \)
- \( \mathbb{CH} F_n (\mathbb{CH} F_n)^{*2} = -F_{n+2} F_{n-1} - F_{2n+5} + 2 F_{n+1} (i F_n + h F_{n+3} - i h F_{n+2}), \) \( n \geq 0 \)
- \( \mathbb{CH} F_n (\mathbb{CH} F_n)^{*3} = F_{2n+1} + F_{n+1} F_{n+4} - 2 F_{n+3} (i F_{n+2} + h F_{n+1} - i h F_n), \) \( n \geq 0 \)
- \( \mathbb{CH} F_n (\mathbb{CH} F_n)^{*4} = F_{2n+1}, \) \( n \geq 0 \)
- \( \mathbb{CH} F_n (\mathbb{CH} F_n)^{*5} = -h (F_{2n+1} - F_{2n+5}), \) \( n \geq 0 \)

The norm of the circular-hyperbolic Fibonacci quaternions \( \mathbb{CH} F_n \) is defined in five different ways as follows:

- \( N_{\mathbb{CH} F_n^{*1}} = ||\mathbb{CH} F_n \times (\mathbb{CH} F_n)^{*1}||^2 \)
  \( = |F_{2n+1} - F_{n+1} F_{n+4} + 2 F_{n+2} (i F_{n+3} + h F_n + i h F_{n+1})|, \)
- \( N_{\mathbb{CH} F_n^{*2}} = ||\mathbb{CH} F_n \times (\mathbb{CH} F_n)^{*2}||^2 \)
  \( = |-F_{n+2} F_{n-1} - F_{2n+5} + 2 F_{n+1} (i F_n + h F_{n+3} - i h F_{n+2})|, \)
- \( N_{\mathbb{CH} F_n^{*3}} = ||\mathbb{CH} F_n \times (\mathbb{CH} F_n)^{*3}||^2 \)
  \( = |F_{2n+1} + F_{n+1} F_{n+4} - 2 F_{n+3} (i F_{n+2} + h F_{n+1} - i h F_n)|, \)
- \( N_{\mathbb{CH} F_n^{*4}} = ||\mathbb{CH} F_n \times (\mathbb{CH} F_n)^{*4}||^2 \)
  \( = F_n^2 + F_{n+1}^2, \)
- \( N_{\mathbb{CH} F_n^{*5}} = ||\mathbb{CH} F_n \times (\mathbb{CH} F_n)^{*5}||^2 \)
  \( = |-h (F_{2n+1} - F_{2n+5})|. \)
In the following theorem, some properties related to circular-hyperbolic Fibonacci quaternions are given.

**Theorem 1.** Let $F_n$ and $\text{CH}F_n$ be the $n$-th terms of Fibonacci sequence $(F_n)$ and circular-hyperbolic Fibonacci quaternion $(\text{CH}F_n)$, respectively. In this case, for $n \geq 1$ we can give the following relations:

\[ \text{CH}F_n = \text{CH}F_{n-1} + \text{CH}F_{n-2}; \]  
\[ \text{CH}F_{n+1} + \text{CH}F_{n-1} = \text{CH}L_n; \]  
\[ \text{CH}F_{n+2} - \text{CH}F_{n-2} = \text{CH}L_n; \]  
\[ \text{CH}F_n - i \text{CH}F_{n+1} - h \text{CH}F_{n+2} - i h \text{CH}F_{n+3} = F_n + F_{n+2} - F_{n+4} - F_{n+6}. \]

*Proof:* Using (14) and (15), the proof can easily be done. □

**Theorem 2. (Honsberger identity)** For $n, m \geq 0$ the Honsberger identity for the circular-hyperbolic Fibonacci quaternions $\text{CH}F_n$ and $\text{CH}F_m$ is given by

\[ \text{CH}F_n \text{CH}F_m + \text{CH}F_{n+1} \text{CH}F_{m+1} = \text{CH}F_{n+m+1} + 2 F_{n+m+6} + i F_{n+m+2} + h F_{n+m+3} + i h F_{n+m+4}. \]

*Proof:* By using (14) we get,

\[ \text{CH}F_n \text{CH}F_m + \text{CH}F_{n+1} \text{CH}F_{m+1} = (F_{n+m+1} - F_{n+m+3} + F_{n+m+5} + F_{n+m+7}) + 2 i F_{n+m+2} + 2 h F_{n+m+3} + 2 i h F_{n+m+4} = \text{CH}F_{n+m+1} + 2 F_{n+m+6} + i F_{n+m+2} + h F_{n+m+3} + i h F_{n+m+4}, \]

where the identity $F_n F_m + F_{n+1} F_{m+1} = F_{n+m+1}$ is used [10, 14, 24, 25]. □

**Theorem 3. (Generating function)** Let $\text{CH}F_n$ be the circular-hyperbolic Fibonacci quaternion. For the generating function for these quaternions is as follows:

\[ g_{\text{CH}F_n}(t) = \sum_{s=0}^{n} \text{CH}F_s t^s = \frac{\text{CH}F_0 + (\text{CH}F_1 - \text{CH}F_0) t}{1 - t - t^2}. \]

*Proof:* Using the definition of generating function, we obtain

\[ g_{\text{CH}F_n}(t) = \text{CH}F_0 + \text{CH}F_1 t + \ldots + \text{CH}F_n t^n + \ldots. \]

Multiplying $(1 - t - t^2)$ both sides of (41) and using (35), we have

\[ (1 - t - t^2) g_{\text{CH}F_n}(t) = \text{CH}F_0 + (\text{CH}F_1 - \text{CH}F_0) t. \]

Thus, the proof is completed. □

**Theorem 4. (Binet’s Formula)** Let $\text{CH}F_n$ be the circular-hyperbolic Fibonacci quaternion. For $n \geq 1$, Binet’s formula for these quaternions is as follows:

\[ \text{CH}F_n = \frac{1}{\alpha - \beta} \left( \hat{\alpha} \alpha^n - \hat{\beta} \beta^n \right), \]

where $\alpha$ and $\beta$ are the roots of the characteristic equation $r^2 - r - 1 = 0$. □
where
\[ \hat{\alpha} = 1 + i \alpha + h \alpha^2 + i h \alpha^3, \quad \alpha = \frac{1 + \sqrt{5}}{2} \]
and
\[ \hat{\beta} = 1 + i \beta + h \beta^2 + i h \beta^3, \quad \beta = \frac{1 - \sqrt{5}}{2}. \]

**Proof:** Binet’s formula of the circular-hyperbolic Fibonacci quaternion is the same as Binet’s formula of the Fibonacci quaternion [8]. \( \square \)

**Theorem 5. (d’Ocagne’s identity)** For \( n, m \geq 0 \) the d’Ocagne’s identity for the circular-hyperbolic Fibonacci quaternions \( CHF_n \) and \( CHF_m \) is given by

\[
CHF_m CHF_{n+1} - CHF_{m+1} CHF_n = (-1)^n F_{m-n} (2 + i + 3h + 4ih) + L_{m-n} (i-h + ih).
\]

**Proof:** By using (14) we get,

\[
CHF_m CHF_{n+1} - CHF_{m+1} CHF_n = 2 (-1)^n F_{m-n} + i (-1)^n (F_{m-n} + L_{m-n}) + h (-1)^n (3 F_{m-n} - L_{m-n}) + i h (-1)^n (4 F_{m-n} + L_{m-n}),
\]

where the identity \( F_n F_m + F_{n+1} F_{m+1} = F_{n+m+1}, F_{n+3} - F_{n-3} = 4 F_n \) and \( F_{n+1} - F_{n-1} = L_n \) are used [14, 24, 25]. \( \square \)

**Theorem 6. (Cassini’s Identity)** Let \( CHF_n \) be the circular-hyperbolic Fibonacci quaternion. For \( n \geq 1 \), Cassini’s identity for \( CHF_n \) is as follows:

\[
CHF_{n+1} CHF_{n-1} - CHF_n^2 = (-1)^n, (2 + 2i + 2h + 5ih).
\]

**Proof:** (44): By using (14) we get

\[
CHF_{n+1} CHF_{n-1} - CHF_n^2 = \left[ (F_{n+1} F_{n-1} - F_n^2) + (F_{n+1}^2 - F_n F_{n+2}) + (F_{n+3} F_{n+1} - F_{n+2}^2) + (F_{n+4} F_{n+2} - F_{n+3}^2) \right] + \left[ (F_{n+2} F_{n-1} - F_{n+1} F_n) + (F_{n+4} F_{n+1} - F_{n+3} F_{n+2}) \right] + \left[ (F_{n+2}^2 - F_n F_{n+2}) + (F_{n+1} F_{n+3} - F_{n+2}^2) + (F_{n+3} F_{n+1} - F_{n+2} F_n) + (F_{n+4} F_{n+2} - F_{n+3} F_{n+1}) \right] + \left[ (F_{n+1} F_{n+2} - F_n F_{n+1}) + (F_{n+4} F_{n-1} - F_{n+3} F_n) + (F_{n+2} F_{n+1} - F_{n+3} F_n) \right] = (-1)^n (2 + 2i + 2h + 5ih).
\]

where the identities of the Fibonacci numbers \( F_m F_{n+1} - F_{m+1} F_n = (-1)^n F_{m-n} \) is used [14, 24, 25]. \( \square \)
Theorem 7. (Catalan’s Identity) Let \( \mathcal{CH}F_n \) be the circular-hyperbolic Fibonacci quaternion. For \( n \geq 1 \), Catalan’s identity for \( \mathcal{CH}F_n \) is as follows:

\[
\mathcal{CH}F_n^2 - \mathcal{CH}F_{n+r} \mathcal{CH}F_{n-r} = (-1)^{n-r} F_r \left[ 2 F_r + i (F_r + L_r) + h (3 F_r - L_r) \right] + i h (4 F_r + L_r). \tag{45}
\]

Proof. By using (14), we get

\[
\mathcal{CH}F_n^2 - \mathcal{CH}F_{n+r} \mathcal{CH}F_{n-r} = \left[ (F_n^2 - F_{n+r} F_{n-r}) - (F_{n+1}^2 - F_{n+r+1} F_{n-r+1}) \right. \\
+ (F_{n+2}^2 - F_{n+r+2} F_{n-r+2}) \\
+ (F_{n+3}^2 - F_{n+r+3} F_{n-r+3}) \right] \\
+ i \left[ (F_n F_{n+1} - F_{n+r} F_{n-r+1}) \\
+ (F_{n+1} F_n - F_{n+r+1} F_{n-r}) \\
- (F_{n+2} F_{n+3} - F_{n+r+2} F_{n-r+3}) \\
+ (F_{n+3} F_{n+2} - F_{n+r+3} F_{n-r+2}) \right] \\
+ h \left[ (F_n F_{n+2} - F_{n+r} F_{n-r+2}) \\
- (F_{n+1} F_{n+3} - F_{n+r+1} F_{n-r+3}) \\
+ (F_{n+2} F_{n} - F_{n+r+2} F_{n-r}) \\
+ (F_{n+3} F_{n+1} - F_{n+r+3} F_{n-r+1}) \right] \\
+ i h \left[ (F_n F_{n+3} - F_{n+r} F_{n-r+3}) \\
+ (F_{n+1} F_{n+2} - F_{n+r+1} F_{n-r+2}) \\
- (F_{n+2} F_{n+1} - F_{n+r+2} F_{n-r+1}) \\
+ (F_{n+3} F_{n} - F_{n+r+3} F_{n-r}) \right] \\
= (-1)^{n-r} F_r \left[ 2 F_r + i (F_r + L_r) + h (3 F_r - L_r) \right] + i h (4 F_r + L_r).
\]

where the identities of the Fibonacci numbers \( F_{n-r} F_{n+r} - F_n^2 = (-1)^{n-r+1} F_r^2 \) and \( F_m F_n - F_{m+r} F_{n-r} = (-1)^{n-r} F_{m+r-n} F_r \) are used [24].

3 Conclusion

In this study, a number of new results on circular-hyperbolic Fibonacci quaternions were derived.
